

BirdShield™ Bird Repellent

Usage & Testing Information

Bird Control in Corn

Bird Shield (tm) has been found to be effective for controlling bird damage to sweet corn and other varieties of corn. In a tests of 14 corn fields, four were left untreated as controls, and ten were treated either once or twice with Bird Shield (tm). The untreated fields averaged approximately 75% damage, while the fields treated twice with Bird Shield (tm) suffered only about 1% damage.

Bird Shield (tm) was most effective when used twice at five day intervals, beginning ten days prior to harvest with one pint of repellent per acre, applied by air, with five gallons of water.
